

Food Ordering Behavior and Consumer Trends: A Structured Analysis of Choices and Habits using Tableau

1.2 – Purpose of the Project

Food Ordering Behavior and Consumer Trends: A Structured Analysis of Choices and Habits Using Tableau

The main goal of this project is to understand how people order food online by looking at data and turning it into useful information with the help of interactive charts in Tableau. We want to find out what patterns people follow when ordering food how often they order, how much they spend and what makes them happy or unhappy.

Online food delivery is becoming more popular so businesses need to know what customers like and what they want. This project helps companies see what trends people follow when it comes to types of food, meals, age groups, cities and restaurants. By looking at these things businesses can make decisions to make customers happier work more efficiently and make more money.

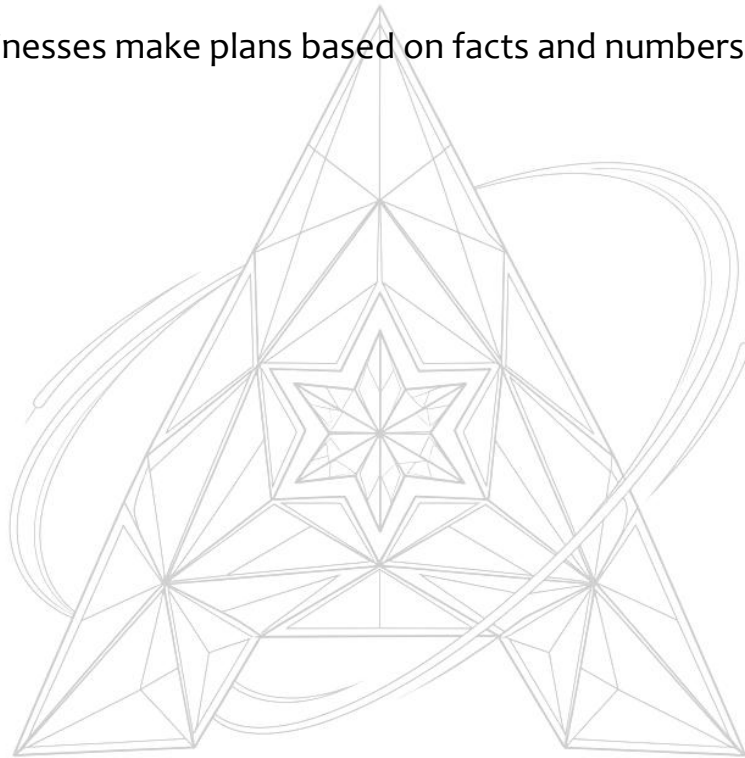

We also want to track numbers like how many orders are placed how much money is made what customers think of the service and how well deliveries are done. The information we get from Tableau helps businesses find ways to grow do a job and make plans to attract more customers.

Purpose Statements

- * To look at how customers order food and what they like.
- * To find out what types of food and meals are most popular.
