Food Ordering Behavior and Consumer Trends: A Simple Look at What People Choose and How They Order Using Tableau

Food Ordering Behavior and Consumer Trends: A Structured Analysis of Choices and Habits using Tableau

The way people order food has changed a lot because of how they live how much they use the internet and how easy it is to order food online.. Companies have a hard time understanding what customers like how they buy food how much they spend and if they are happy. If they do not look at the data carefully they might not know what kind of food people like the most, how to make their menus better how to deliver food faster and how to make customers happier.

This project is about taking all the data from food orders and making it into something that makes sense. We used Tableau to look at the data and make pictures that show what is going on. We wanted to know how people order food what they like to eat how money they spend, what they think of the food and how well the delivery people do their jobs. We looked at all this information for kinds of people and places. By doing this we hope to understand how customers behave and help companies make decisions.

The Tableau pictures and stories we made are interactive so people who care about the company can watch what is happening see what customers are doing and get ideas that can help the company work better make customers happier and make money.

Key Problems We Are Trying to Fix

- We do not really know what kind of food people like to order.
- It is hard to know what kind of food people want the most.
- We do not know how people spend their money on food.
- It is hard to know if customers are happy with their food.
- We do not know how well the delivery people are doing their jobs.
- It is hard to compare how different people order food in cities and, at different restaurants.
- We do not have a way to watch what is happening and make decisions. ✨
