

# Food Ordering Behavior and Consumer Trends: A Structured Analysis of Choices and Habits using Tableau

---

## CHAPTER – X

### CONCLUSION

#### 10.1 – Conclusion

##### Project

##### **Food Ordering Behaviour and Consumer Trends: A Structured Analysis of Choices and Habits**

This Food Ordering Behaviour and Consumer Trends project was a success because it looked at Food Ordering Behaviour and Consumer Trends in a detailed way. The project used data visualization and business intelligence techniques to do this. It used Tableau Desktop to turn the Food Ordering Behaviour data into information that people could understand. This was done with the help of dashboards and other tools like KPI indicators and charts.

The project found out what customers like, what kind of food is popular when people order food how happy customers are, how well deliveries are done and what foods make the money. By getting the Food Ordering Behaviour data ready and visualizing it the project helped people understand what customers do and what is happening in the Food Ordering Behaviour industry.

The project also made it easier for people to see the information by putting the Tableau dashboards on a website that uses Flask. This meant that people who are interested could look at the information in a way that's easy to use. The solution that was developed helps businesses make decisions by looking at data. This means they can make their menus better make customers happier make deliveries better and make money.

The project showed that modern analytics tools and web technologies like Python and Tableau Public can be used to build an analytics platform. The project was tested to make sure it works well. It does.

In conclusion Food Ordering Behaviour and Consumer Trends: A Structured Analysis of Choices and Habits is a solution that can be used to understand how customers order food and how businesses are doing. The information from this Food Ordering Behaviour and Consumer Trends project can help food delivery companies, restaurants and business managers make decisions work better and grow in a competitive market.

##### **Future Scope**

- \* The project could be connected to real-time Food Ordering Behaviour databases.
- \* It could use analytics to forecast demand.
- \* It could use machine learning models to predict what customers like.
- \* It could develop a system that recommends food to customers based on their preferences.

## Food Ordering Behavior and Consumer Trends: A Structured Analysis of Choices and Habits using Tableau

---

- \* It could be made into an application so more people can use it.
- \* It could do an analysis of what customers think by looking at reviews and feedback, about Food Ordering Behaviour.
