

CHAPTER – XI

FUTURE SCOPE

11.1 - Future Scope

The current project gives us a lot of information about how customers order food what kind of food they like, how well deliveries are done and how much money is made. We can look at all this information in an easy way with interactive dashboards and visual analytics.. There are many ways we can make the system even better and add more features to it in the future.

1. Getting Data in Real Time

We can make the project better by connecting it to the systems that take food orders and to databases. This way we can see what is happening with orders and how the business is doing at any time without having to wait for someone to update the information.

2. Predicting What Will Happen

We can use computer models to predict what will happen in the future like when a lot of people will be ordering food, what kind of food they will want and how much money the business will make. This will help businesses make decisions and use their resources well.

3. Recommending Food to Customers

We can use computer algorithms to suggest food to customers based on what they like what they have ordered before and how they behave. This will make customers happier and more likely to come

4. Understanding Our Customers

Food Ordering Behavior and Consumer Trends: A Structured Analysis of Choices and Habits using Tableau

We can use the system to learn more about our customers like how old they're where they live and what they like. This will help businesses make offers and marketing campaigns that are just right for certain groups of customers.

5. Seeing What Customers Think

We can look at what customersre saying about us in reviews and feedback and use special computer techniques to understand what they mean. This will help us see what we are doing well and what we need to improve.

6. Making a Mobile App

We can make an app for phones and tablets that will let managers and people who care about the business see how things are going no matter where they are.

7. Understanding Where Our Customers Are

We can use maps and location tools to see where our customers are, what kind of food they like in different areas and where we should open new locations.

8. Using Cloud Computing

We can put the system on cloud platforms, which will make it easier to use more secure and able to handle users and locations.

9. Making Reports Automatically

In the future the system can make reports every day, week or month. Send them to the people who need to see them without anyone having to do it by hand.

10. Adding Business Tools

We can add more features to the system like looking at how much money each customer will spend over their lifetime predicting which customers might leave and seeing how well the business is doing. This will help businesses make decisions and plan for the future.

Expected Future Benefits

We will be better at predicting what customers will want.

Food Ordering Behavior and Consumer Trends: A Structured Analysis of Choices and Habits using Tableau

Customers will have an experience because we can suggest food just for them.

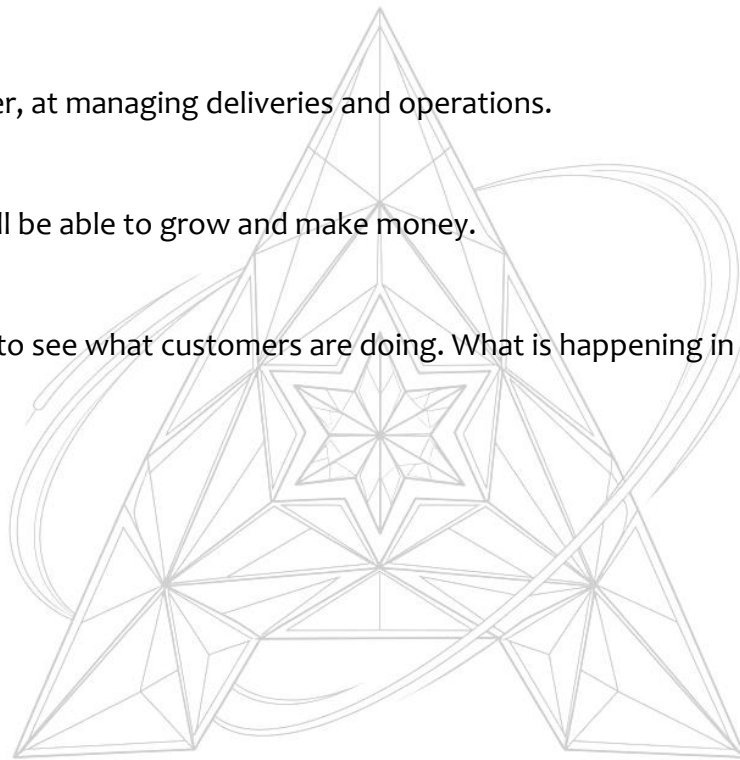

We will be able to make decisions and with more information.

Our marketing will be more effective.

We will be better, at managing deliveries and operations.

The business will be able to grow and make money.

We will be able to see what customers are doing. What is happening in the market in real time.
